

Assembling Your Sta-Real Watering System:

1. Remove the two thin white rod segments and set them aside. Leave the tube with the rod and float segment intact.
2. Using the connector pin at the end of the rod, attach it to the rod and float segment.
3. Pass the end of the rod assembly through the eye of the coupler bushing in the clear tube.
4. Using gentle pressure, twist and push the tubes together.
5. Repeat steps 2, 3, and 4, for the last segment of white rod and clear tube.
6. Pass the end of the last white rod through the center hole of the filler funnel as you push the funnel base down into the last clear tube segment.
7. Assembly is complete, and you're ready to install your Sta-Real Christmas Tree Watering System!

You always know when your tree needs water, simply by looking at the indicator in the funnel. When it's up, your tree has water. When it's down, it's time to water. Simply add water directly through the funnel until the indicator comes back up, and you're done!

Happy Holidays and thank you for choosing the *Sta-Real Tree Watering System* to make your Christmas Tree a lasting part of the holiday season.

Follow these easy instructions to assemble your Sta-Real system and install it in your tree

1. Make sure your tree has been freshly cut to ensure optimum absorption of water from the system.
2. Place the tree in your stand in its permanent location. Fill the water reservoir in the stand to its maximum capacity.
3. Check the float/indicator assembly on the watering system. It should move freely up and down within the water delivery tube.
4. Choose a spot on your tree where the Sta-Real watering funnel will be located permanently for the season. The spot should be about four feet above the floor and a few inches inside the branch line. The clear plastic funnel hardly shows, so make it convenient.
5. Slide the Sta-Real water delivery tube down through the branches of the tree, placing it in the water reservoir of your tree stand.
6. Look at the base of the tube to make sure the float is submerged halfway in the water. This is the last time you'll be underneath your tree this season!
7. The white indicator stick on your Sta-Real watering system will be sticking up in the "full" position, indicating the water reservoir of tree stand is full of water. Take this opportunity to mark the indicator with a permanent marker.
8. As your tree uses water from the reservoir, the indicator stick—along with your mark—will move down the funnel and filler tube. Add water as needed to bring the level back up, making sure not to overfill the reservoir. Pour fresh water directly into the funnel until the mark returns to its original position.
